YouTube Tech RevieIr Program By Soham

Video-level performance data was collected using the YouTube Data API and transformed in Python to build an analytics dataset. Engineered metrics included engagement rate, views per subscriber (reach efficiency), views per day (momentum), and content duration segments. These features Ire used to analyze creator performance and content format impact in a PoIr BI dashboard.

This analysis evaluates the performance of a technology creator marketing program and identifies which creators and content formats should receive increased investment in the next campaign cycle.

What I Set Out to Do: Eight YouTube tech revieIrs. One question: **which ones are worth the budget?**

I pulled data on 220 videos across MKBHD, Linus Tech Tips, JerryRigEverything, Unbox Therapy, Dave2D, TechLinked, Arun Maini, and MrMobile using the YouTube Data API, real views, likes, comments, and duration. No modeled numbers.

The framework uses three layers: awareness (reach), engagement (interaction quality), and consideration proxied by views per subscriber and views per day. Where direct conversion data doesn't exist, it doesn't, the public API doesn't expose it, I say so and use the closest behavioral signal available.

The Numbers:

220 videos. 227M total views. 4.1% program engagement rate, which clears the "good" threshold of 3.0%. That's the headline. It's fine. But averages hide things, and what they're hiding here is more interesting than the average itself.

Channel	Avg Views	Engagement Rate	ER Flag
TechLinked	474K	5.12%	Great
Linus Tech Tips	791K	4.78%	Good
MrMobile	247K	4.40%	Good
JerryRigEverything	2.16M	3.88%	Good
Arun Maini	12K	3.85%	Good
Dave2D	690K	3.46%	Good
MKBHD	3.99M	3.00%	At floor
Unbox Therapy	541K	1.89%	Below benchmark

What's Actually Going On:

- **TechLinked.** 5.12% engagement rate. 0.24 views per subscriber, best reach efficiency in the group. They have 1.99M subscribers, not 20M, and they're still outperforming channels with ten times the audience on every quality metric. That's where you put more budget.
- **MrMobile has a distribution problem, not a content problem.** Overall ER sits at 4.4%, which is solid. Filter to their long-form videos (20+ minutes) and it jumps to 8.56%, the single highest number in the entire dataset. The content is working. It's just not getting pushed. More promotion, more long-form deals, see what happens.

- **MKBHD is the awkward one.** Biggest raw reach by a wide margin, 4M average views per video. But engagement has settled at exactly 3.0%, the benchmark floor. No headroom. It's a reach play, not an engagement play. Worth keeping if top-of-funnel awareness is the goal, but it shouldn't be eating budget as if it's driving consideration.
- **JerryRigEverything** is the most consistent bet. 3.88% ER, 2.16M average views, 40 videos of data. No red flags. Reliable output.
- **Unbox Therapy and Arun Maini**, four videos and six videos respectively. That's not enough data to say anything. The 1.89% from Unbox Therapy looks bad, but it could be a rough patch rather than a structural problem. Don't cut. Pull 50 videos and look again.

The Format Pattern:

Long-form videos (20+ minutes) have the highest engagement rate (5.0%) and the highest average views (1.19M). Short videos (under 5 minutes) have the loIst on both, 3.7% ER, 0.82M average views.

This holds across almost every channel in the dataset. It's not surprising when you say it out loud: someone who sits through a 25-minute tech review is more invested than someone who watched a 3-minute clip. But most programs don't optimize for it because long-form is harder to negotiate. The Q2 brief should push toward dedicated long-form content with TechLinked, JerryRigEverything, and MrMobile specifically.

The engagement rate heatmap makes this visible at a glance, MrMobile's Deep Dive cell is noticeably darker than everything around it.

Q2 Budget Calls:

- **Increase:** TechLinked. Best engagement efficiency, best reach relative to audience size. First priority.
- **Maintain + rebrief:** MKBHD. Keep for reach, but negotiate long-form formats. Their Deep Dive ER (4.21%) is a full point higher than their medium-length ER (3.29%). The format matters.
- **Maintain + push distribution:** MrMobile. The content quality is clearly there. The problem is reach, not engagement. Ask the brand's distribution team to amplify.
- **Hold for more data:** Unbox Therapy and Arun Maini. Expand the video pull before making any call.
- **Dave2D:** Leave it. Quietly reliable. No reason to change anything.

What This Analysis Can't Tell You:

The public YouTube API doesn't expose watch time, link click-throughs, or anything that happens after someone leaves YouTube. The consideration layer here is proxied, not measured directly.

To close the loop on revenue, connect UTM-tagged description links to GA4 or Shopify. That turns engagement rates into ROAS. Layering in Google Trends API data would add branded search lift, whether creator activity moves direct brand searches, which is a one-day integration and worth doing before Q2 launches.

The MrMobile 8.56% Deep Dive finding is the most immediately actionable number in this dataset. If one thing shapes the Q2 brief, it should be that: long-form content with this creator is working at nearly double the program average, and right now the distribution doesn't match the content quality.
